Education

University of South Carolina - Columbia, SC | B.S. in Computer Science | GPA: 4.0/4.0 *Expected: May 2027*

Relevant Coursework: Data Structures & Algorithms, Operating Systems, Software Engineering, Artificial Intelligence

Technical Skills

- **Programming languages:** Java, C#, Kotlin, JavaScript, Python, C++, MySQL
- **Front-End Technologies:** HTML, CSS, XML
- **Frameworks:** .NET, Node.js, React, Jest, JUnit, JavaFX
- **Tools:** Git/GitHub, PowerShell, Bash, Azure DevOps, Claude Code, Linux, Microsoft Office
- **Concepts:** Agile development, Android development, object-oriented programming, Unit testing

Software Engineering Work Experience

Software Engineer Intern | Textron Specialized Vehicles, E-Z-GO, Augusta GA *June 2026-August 2026*

Java/Kotlin Android & C#.NET Server: Azure DevOps, 6-person Agile Team

- Owned a tablet golf-distance-adjustment feature end-to-end: queried the site-wide course database via LINQ to retrieve per-hole pin altitude for all TruPin-enabled courses, combined it with live tablet GPS altitude, and displayed the result as a “plays like” adjusted-yardage value in the tablet UI.
- Built a UDP-based service that relays hourly Perry Weather API wind speed/direction data to tablets on request.
- Wrote a client-side pathway polling the server every 5 minutes to render live beverage-cart locations on the tablet map view.

Projects

Music Writing App (Demo) | Java, JSON, JavaFX, JUnit, XML, GitHub *January 2025-May 2025*

- Built the song library, login, and settings UI, as well as editing logic for a Song-Measure-Note/Chord hierarchy, where note and chord selection are constrained by the song's key.
- Designed song ownership model where song authors could edit, delete, copy, or publish songs, with published songs playable and copyable by all users.
- Translated faux non-technical client's feature requests, gathered in twice-weekly meetings, into technical requirements and prioritized features, tracked via GitHub Projects.
- Wrote and executed over 100 JUnit tests covering backend song-library and song-creation logic.

Amazon Website (source code) | JavaScript, Jest, Git, HTML5, CSS3 *January 2026-April 2026*

- Implemented the JavaScript logic across a multi-page Amazon-replica app (product, cart, order, and tracking pages), including dynamic checkout delivery-date logic and a delivery-progress tracking bar.
- Fetched product/cart data asynchronously via a REST API; implemented event-driven UI updates through DOM manipulation.
- Used localStorage for persistent client-side data across sessions; created 15 test cases using Jest.

Voter Turnout Visualization (source code) | Python, Pandas, Plotly *April 2026*

- Built a data pipeline to parse, clean, and merge 3 inconsistently formatted datasets (500+ records) from raw Excel exports, using regex extraction to recover multi-level header structure buried in a single column.
- Designed 7 interactive, animated Plotly visualizations to surface turnout trends across income and demographic groups spanning 1978–2024.
